

# Manipulating Data in R

John Muschelli

January 4, 2016

## Overview

In this module, we will show you how to:

1. Perform operations by a grouping variable
2. Reshaping data from long (tall) to wide (fat)
3. Reshaping data from wide (fat) to long (tall)

## Setup

We will show you how to do each operation in base R then show you how to use the `dplyr` or `tidyr` package to do the same operation (if applicable).

See the “Data Wrangling Cheat Sheet using `dplyr` and `tidyr`”: \*  
<https://www.rstudio.com/wp-content/uploads/2015/02/data-wrangling-cheatsheet.pdf>

## Load the packages/libraries

```
library(dplyr)
```

# Reshaping data from wide (fat) to long (tall)

## Resources

See [http://www.cookbook-r.com/Manipulating\\_data/Converting\\_data\\_between\\_wide\\_and\\_long\\_format/](http://www.cookbook-r.com/Manipulating_data/Converting_data_between_wide_and_long_format/)

### Reshaping data from wide (fat) to long (tall): base R

The reshape command exists. It is a **confusing** function. Don't use it.

### Reshaping data from wide (fat) to long (tall): tidyr

In tidyr, the gather function gathers columns into rows.

We want the column names into "type" variable in the output dataset and the value in "number" variable

```
long = gather(ex_data, "var", "number",  
              starts_with("orange"),  
              starts_with("purple"), starts_with("green"),  
              starts_with("banner"))  
  
head(long)
```

# Reshaping data from long (tall) to wide (fat)

## Reshaping data from long (tall) to wide (fat): tidyr

In `tidyr`, the `spread` function spreads rows into columns. Now we have a long data set, but we want to separate the Average, Alightings and Boardings into different columns:

```
# have to remove missing days
wide = filter(long, !is.na(date))
wide = spread(wide, type, number)
head(wide)
```

	day	date	line	Alightings	Average	Boardings
1	Friday	2010-01-15	banner	NA	NA	NA
2	Friday	2010-01-15	green	NA	NA	NA
3	Friday	2010-01-15	orange	1643	1644	1645
4	Friday	2010-01-15	purple	NA	NA	NA
5	Friday	2010-01-22	banner	NA	NA	NA
6	Friday	2010-01-22	green	NA	NA	NA

# Perform Operations By Groups of Variables

## Perform Operations By Groups: base R

The `tapply` command will take in a vector (`X`), perform a function (`FUN`) over an index (`INDEX`):

```
args(tapply)
```

```
function (X, INDEX, FUN = NULL, ..., simplify = TRUE)
NULL
```

## Perform Operations By Groups: base R

Let's get the mean Average ridership by line:

```
tapply(wide$Average, wide$line, mean, na.rm = TRUE)
```
